```

```
-rw-r--r--@ 1 cveres  staff  722 20 Aug 15:26 ex1.n3
```

# SEMANTICS

- Semantics = “Meaning”
  - What is “meaning”?
  - “Everybody loves somebody.”
  - Montague grammar, Prototype theory, Model theoretic semantics, Lexical and conceptual semantics, semantics of programming languages, memory for meaning, .....
- Meaning (for us) = Metadata++

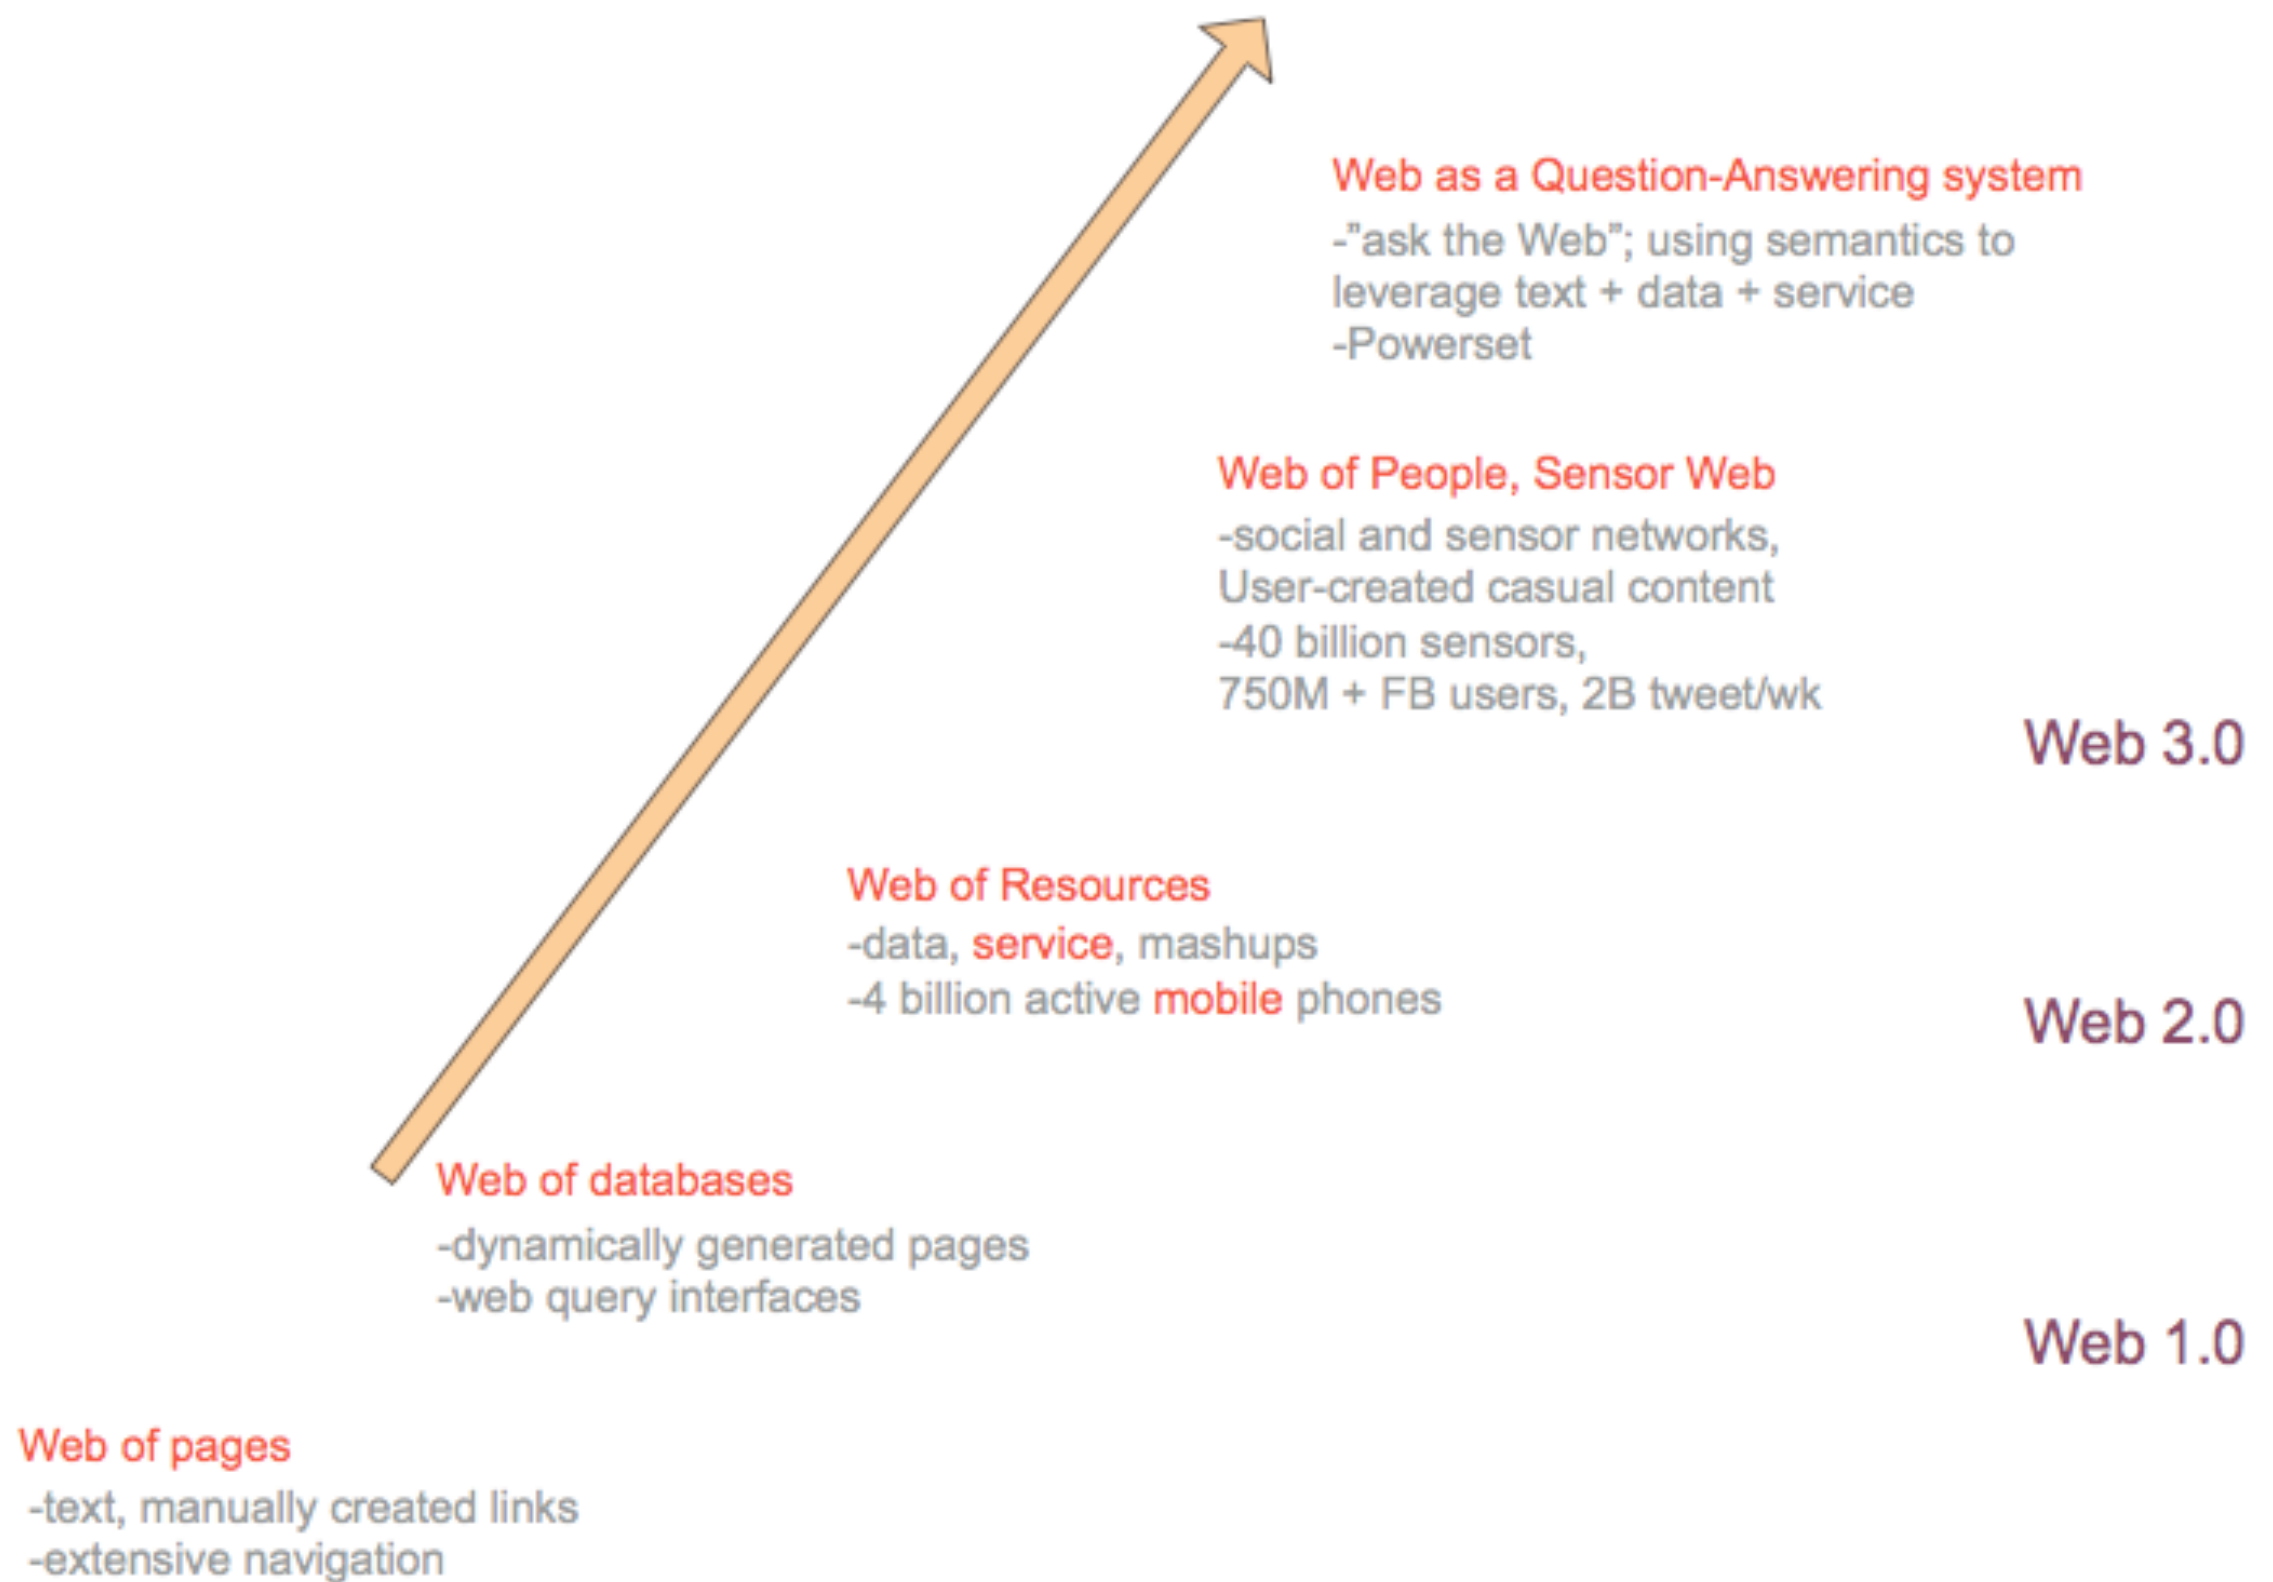

# WHY DO WE NEED SEMANTICS?

- Web 3.0 has become a repository of an ever growing variety of Web resources
  - enterprise data and services
  - social networks
  - cloud computing
  - mobile
  - “Internet of things”

# CHALLENGES

- “Big Data”
  - heterogeneity (variety)
  - scale (volume)
  - continuous changes (velocity)

**Figure 1.1:** Evolution of Web.

# BIG DATA

- A Boeing jet generates 10 terabytes of information per engine every 30 minutes of flight, according to Stephen Brobst, the CTO of Teradata. So for a single six-hour, cross-country flight from New York to Los Angeles on a twin-engine Boeing 737 — the plane used by many carriers on this route — the total amount of data generated would be a massive 240 terabytes of data. There are about 28,537 commercial flights in the sky in the United States on any given day.

# WHAT TO DO?

- We can no longer store all the data that are generated
- But we want to
  - search, browse, integrate, mine, ....
  - ultimately use them to gain insight, develop situational awareness, discover new knowledge, answer difficult questions, and make decisions.
- Automatically relate, disambiguate, understand, and abstract data

# HOW DID WE GET INTO THIS MESS?

- 1980s: client-server paradigm
- For each function, there was a separate server and client program.
  - FTP was used to share files
  - TELNET was used to access different machines
  - EMAIL was used for private communication
  - USENET was used for public exchanges.

# WEB IS BORN

ORGANISATION EUROPEENNE POUR LA RECHERCHE NUCLEAIRE  
**CERN** EUROPEAN ORGANIZATION FOR NUCLEAR RESEARCH

## STATEMENT CONCERNING CERN W3 SOFTWARE RELEASE INTO PUBLIC DOMAIN

### TO WHOM IT MAY CONCERN

#### Introduction

The World Wide Web, hereafter referred to as W3, is a global computer networked information system.

The W3 project provides a collaborative information system independent of hardware and software platform, and physical location. The project spans technical design notes, documentation, news, discussion, educational material, personal notes, publicity, bulletin boards, live status information and numerical data as a uniform continuum, seamlessly intergated with similar information in other disciplines.

The information is presented to the user as a web of interlinked documents.

Access to information through W3 is:

- via a hypertext model;
- network based, world wide;
- information format independent;
- highly platform/operating system independent;
- scalable from local notes to distributed data bases.

Webs can be independent, subsets or supersets of each other. They can be local, regional or worldwide. The documents available on a web may reside on any computer supported by that web.

#### Declaration

The following CERN software is hereby put into the public domain:

- W3 basic ("line-mode") client
- W3 basic server
- W3 library of common code.

CERN's intention in this is to further compatibility, common practices, and standards in networking and computer supported collaboration. This does not constitute a precedent to be applied to any other CERN copyright software.

CERN relinquishes all intellectual property rights to this code, both source and binary form and permission is granted for anyone to use, duplicate, modify and redistribute it.

CERN provides absolutely NO WARRANTY OF ANY KIND with respect to this software. The entire risk as to the quality and performance of this software is with the user. IN NO EVENT WILL CERN BE LIABLE TO ANYONE FOR ANY DAMAGES ARISING OUT THE USE OF THIS SOFTWARE, INCLUDING, WITHOUT LIMITATION, DAMAGES RESULTING FROM LOST DATA OR LOST PROFITS, OR FOR ANY SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES.

Tim Berners-Lee with Nicola Pellow, the writer of the line-mode browser for the World Wide Web next to the NeXT computer in 1991.

# World Wide Web

The WorldWideWeb (W3) is a wide-area [hypermedia](#) information retrieval initiative aiming to give universal access to a large universe of documents.

Everything there is online about W3 is linked directly or indirectly to this document, including an [executive summary](#) of the project, [Mailing lists](#) , [Policy](#) , November's [W3 news](#) , [Frequently Asked Questions](#) .

## [What's out there?](#)

Pointers to the world's online information, [subjects](#) , [W3 servers](#), etc.

## [Help](#)

on the browser you are using

## [Software Products](#)

A list of W3 project components and their current state. (e.g. [Line Mode](#) ,X11 [Viola](#) , [NeXTStep](#) , [Servers](#) , [Tools](#) ,[Mail robot](#) ,[Library](#) )

## [Technical](#)

Details of protocols, formats, program internals etc

## [Bibliography](#)

Paper documentation on W3 and references.

## [People](#)

A list of some people involved in the project.

## [History](#)

A summary of the history of the project.

## [How can I help ?](#)

If you would like to support the web..

## [Getting code](#)

Getting the code by [anonymous FTP](#) , etc.

- Uniform Resource Locator (URL)
  - communication protocol [http, telnet, ftp, mail, etc.]
  - machine [IP address]
  - full-path address [in a directory]
- HyperText Transmission Protocol (HTTP) was developed for text-based request-response communication
- HyperText Markup Language (HTML), an application /instance of SGML

# SEARCH

- As web grew, people needed some way of finding stuff
- keyword search
  - pure keyword
  - TF/IDF
  - links (page rank) (implicit metadata?)
- category systems (semantics!)

# 2003. WEB 2.0

- read / write web
- users generated content
- interact and collaborate with each other in a social media
  - social networking sites, blogs, wikis, video sharing sites, folksonomies,

# WEB 2.0 TECHNOLOGIES

- Emerging new standards and technologies
- XML
- AJAX (Asynchronous JavaScript and XML that enables Web applications to retrieve data from the server asynchronously without interfering with the existing page)
- JSON (JavaScript Object Notation, lightweight data interchange)
- RSS (Really Simple Syndication that allows subscription to feeds such as News, Events, Sports, etc.)
- P2P (Peer to Peer) content sharing systems

# WHAT ABOUT SEMANTICS ?

- Tags (early promise, but limited)
- Clustering, aggregation
- By 2006, there were 100 million websites, 9 billion web pages, and 1 billion global users.
- Something had to be done!

# 2006. WEB 3.0

- Currently there are approximately 250 million websites and 32 billion web pages
- If we are to have any chance of organizing, integrating and understanding this mass of data, then the data will have to be self describing in some way: we have to know what the data is about, and machines will have to be able to reason about the data.

Source: Radar Networks & Nova Spivack, 2007 - [www.radarnetworks.com](http://www.radarnetworks.com)

# A SEMANTIC WEB

- “If HTML and the Web made all the online documents look like one huge book, RDF, schema, and inference languages will make all the data in the world look like one huge database”
- integrating information about the same concept or object in a different modality and media
- Intelligent processing: objects, relationships, semantic search instead of text and keyword search.
- Knowledge enabled computing
- Abstraction

# SOME POSSIBILITIES

- Providing semantics to data involves understanding entities, actions, and relationships the data describe
- Implicit semantics: the meaning of the data is in the patterns which are not explicitly represented.
- Formal semantics. Use of an artificial logical language designed for knowledge representation and reasoning.

# IMPLICIT SEMANTICS

- Link structure
- Clusters, word co-occurrence
- Contextual disambiguation

# FORMAL SEMANTICS

- Family of logics
  - FOL
  - Higher order logics
    - modal, deontic, etc.
  - Description logics
- Compositionality
