

## SUMO

## Mid-Level Ontology

Communications, Countries and Regions, distributed computing,  
Economy, Finance, engineering components, Geography,  
Government, Military,  
North American Industrial Classification System,  
People, physical elements, Transnational issues,  
Transportation, Viruses, World Airports

# Csaba Veres

*Ontologies*

# Ontology

- ◆ Textbook: p. 27 - p. 33
- ◆ Gruber
  - ◆ “An ontology is an explicit (formal) specification of a conceptualisation.”
  - ◆ philosophy, where an ontology is a systematic account of existence
  - ◆ In information science
    - ◆ ontology commitment
    - ◆ terminological agreement

# Making ontologies

- ◆ Defining classes
- ◆ Arranging the classes in a taxonomic (subclass—superclass) hierarchy
- ◆ Defining attributes/relationships and describing allowed values for these.

# Ontology Development 101

- ◆ Determine the domain and scope of the ontology
  - ◆ What is the domain that the ontology will cover?
  - ◆ For what we are going to use the ontology?
  - ◆ For what types of questions the information in the ontology should provide answers?
  - ◆ Who will use and maintain the ontology?

# Scope

- ◆ Competency questions.
- ◆ e.g. wine ontology
- ◆ Which wine characteristics should I consider when choosing a wine?
  - ◆ Is Bordeaux a red or white wine?
  - ◆ Does Cabernet Sauvignon go well with seafood?
  - ◆ What is the best choice of wine for grilled meat?
  - ◆ Which characteristics of a wine affect its appropriateness for a dish?
  - ◆ Does a bouquet or body of a specific wine change with vintage year?
  - ◆ What were good vintages for Napa Zinfandel?

# Reuse

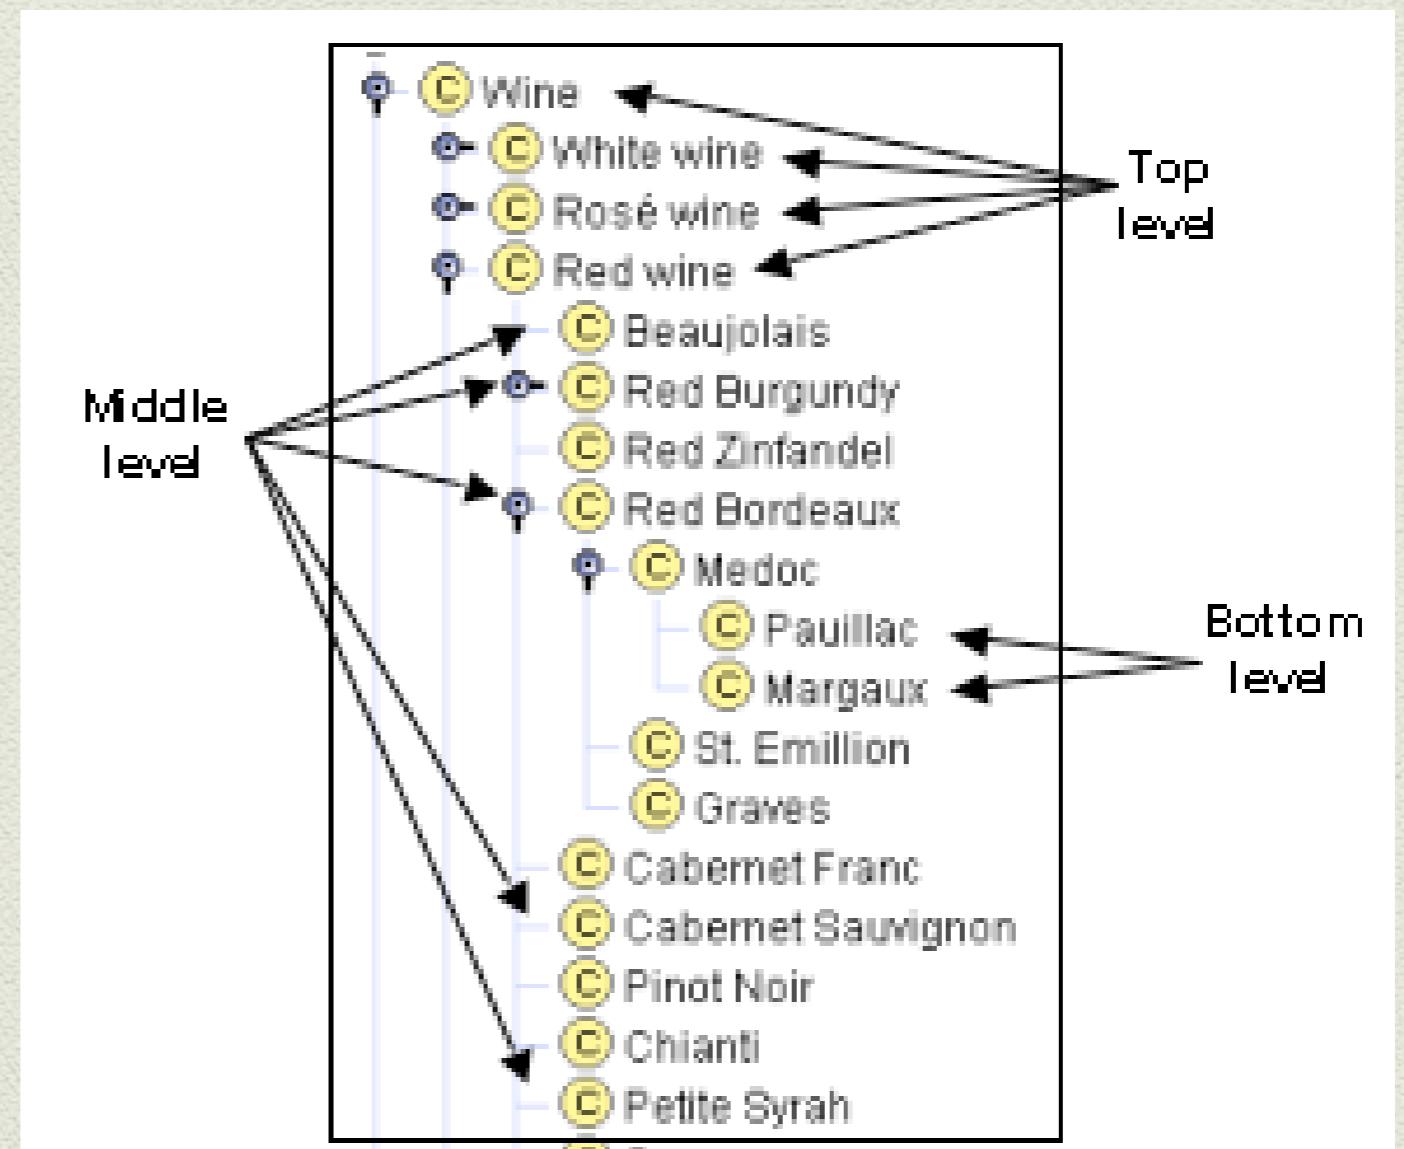

- ◆ Consider reusing existing ontologies
  - ◆ [http://protegewiki.stanford.edu/wiki/  
Protege\\_Ontology\\_Library](http://protegewiki.stanford.edu/wiki/Protege_Ontology_Library)
  - ◆ <http://www.daml.org/ontologies/>
  - ◆ <http://onki.fi>
- ◆ Google e.g. beer ontology
  - ◆ [http://www.knoodl.com/ui/groups/  
Mapping\\_Ontology\\_Community/vocab/Beer\\_Ontology](http://www.knoodl.com/ui/groups/Mapping_Ontology_Community/vocab/Beer_Ontology)

# First Step - List terms

- ◆ What are the terms we would like to talk about?
- ◆ What properties do those terms have?
- ◆ e.g. wine
  - ◆ important wine-related terms will include *wine, grape, winery, location, a wine's color, body, flavor and sugar content; different types of food, such as fish and red meat; subtypes of wine such as white wine, and so on*

# Define classes

- ◆ Top-down
  - ◆ danger of starting with too few general concepts
- ◆ Bottom-up
  - ◆ start with a large set of specific classes (too large?)
- ◆ Combination

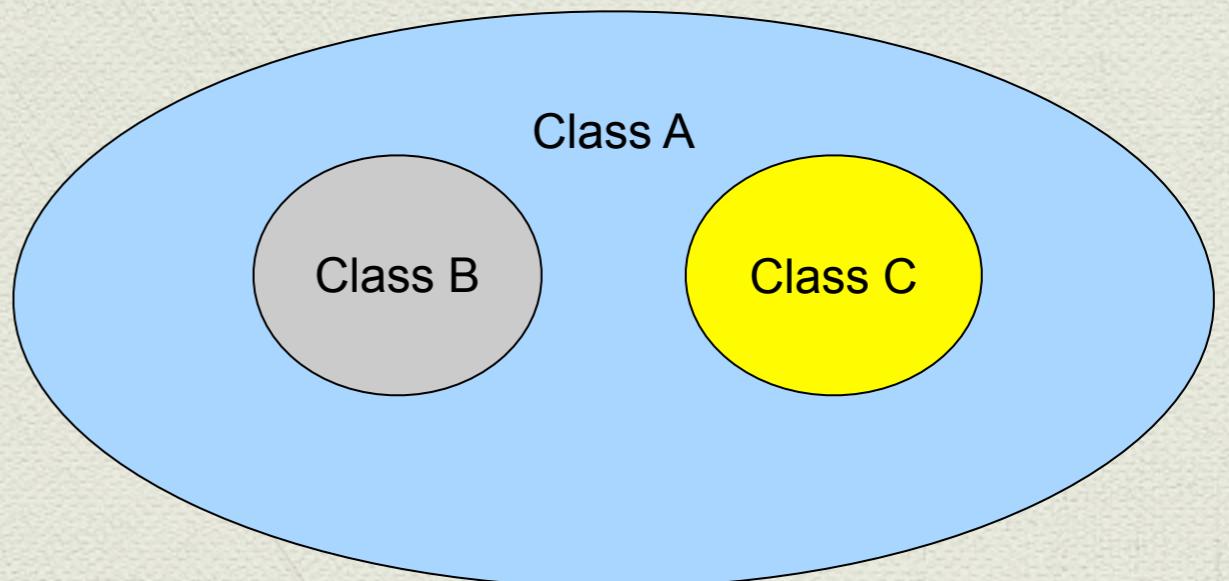

# Good classes

- ◆ Sortal: (Roughly) the (count) nouns in natural language.
- ◆ supplies a principle for distinguishing and counting individual particulars which it collects
  - ◆ Substantial: corresponding to types, like person
  - ◆ Non-substantial: corresponding to roles, like student
- ◆ Non-sortal: (Roughly) adjectives and verbs in natural language.
  - ◆ Relationships
  - ◆ (Mass) Nouns
    - ◆ Women, Fire, and Dangerous Things
    - ◆ Water, Furniture, .....

# Subclass / Superclass

If a class A is a superclass of class B, then every instance of B is also an instance of A

- Class B imply Class A?
- Class C imply Class A?
- Class A imply Class B?

# Subclasses

- ◆ When do we want new sub classes?
- ◆ Subclasses have
  - ◆ additional properties
  - ◆ participate in different relationships

# Class properties

- ◆ classes alone will not provide enough information to answer the competency questions
- ◆ we must describe the internal structure (properties) of concepts
- ◆ Properties are *relations between individuals*
- ◆ From the wine vocabulary these include color, body, flavour ..

# Property values

- ◆ What kind of property is it? What kind of values can it have?
- ◆ Cardinality
  - ◆ min, max, exact
- ◆ Type
  - ◆ String, Number, Boolean, Enumerated (possible values)
  - ◆ Literal value or Instance?
- ◆ How do we tell if it should be an instance?

# Instance or literal?

# Does the range have a “life of its own”?

- ◆ Is the property value part of another taxonomy?
- ◆ Do you want to be precise about the value?

# Class or attribute value?

- ◆ Publication
  - ◆ publication\_type: serial, periodical, single
- ◆ OR
- ◆ Periodical\_Publication
- ◆ Depends:
  - ◆ Are there different kinds of Periodical\_Publication?
    - ◆ newspaper, journal, magazine

# Instance vs. Subclass

- ◆ Sometimes difficult to decide

```
@prefix ex: <http://example.org/>
```

```
ex:Breed rdf:type owl:Class .
```

```
ex:LargeBreed rdf:type owl:Class;
```

```
    rdfs:dubClassOf ex:Breed .
```

```
ex:SmallBreed rdf:type owl:Class;
```

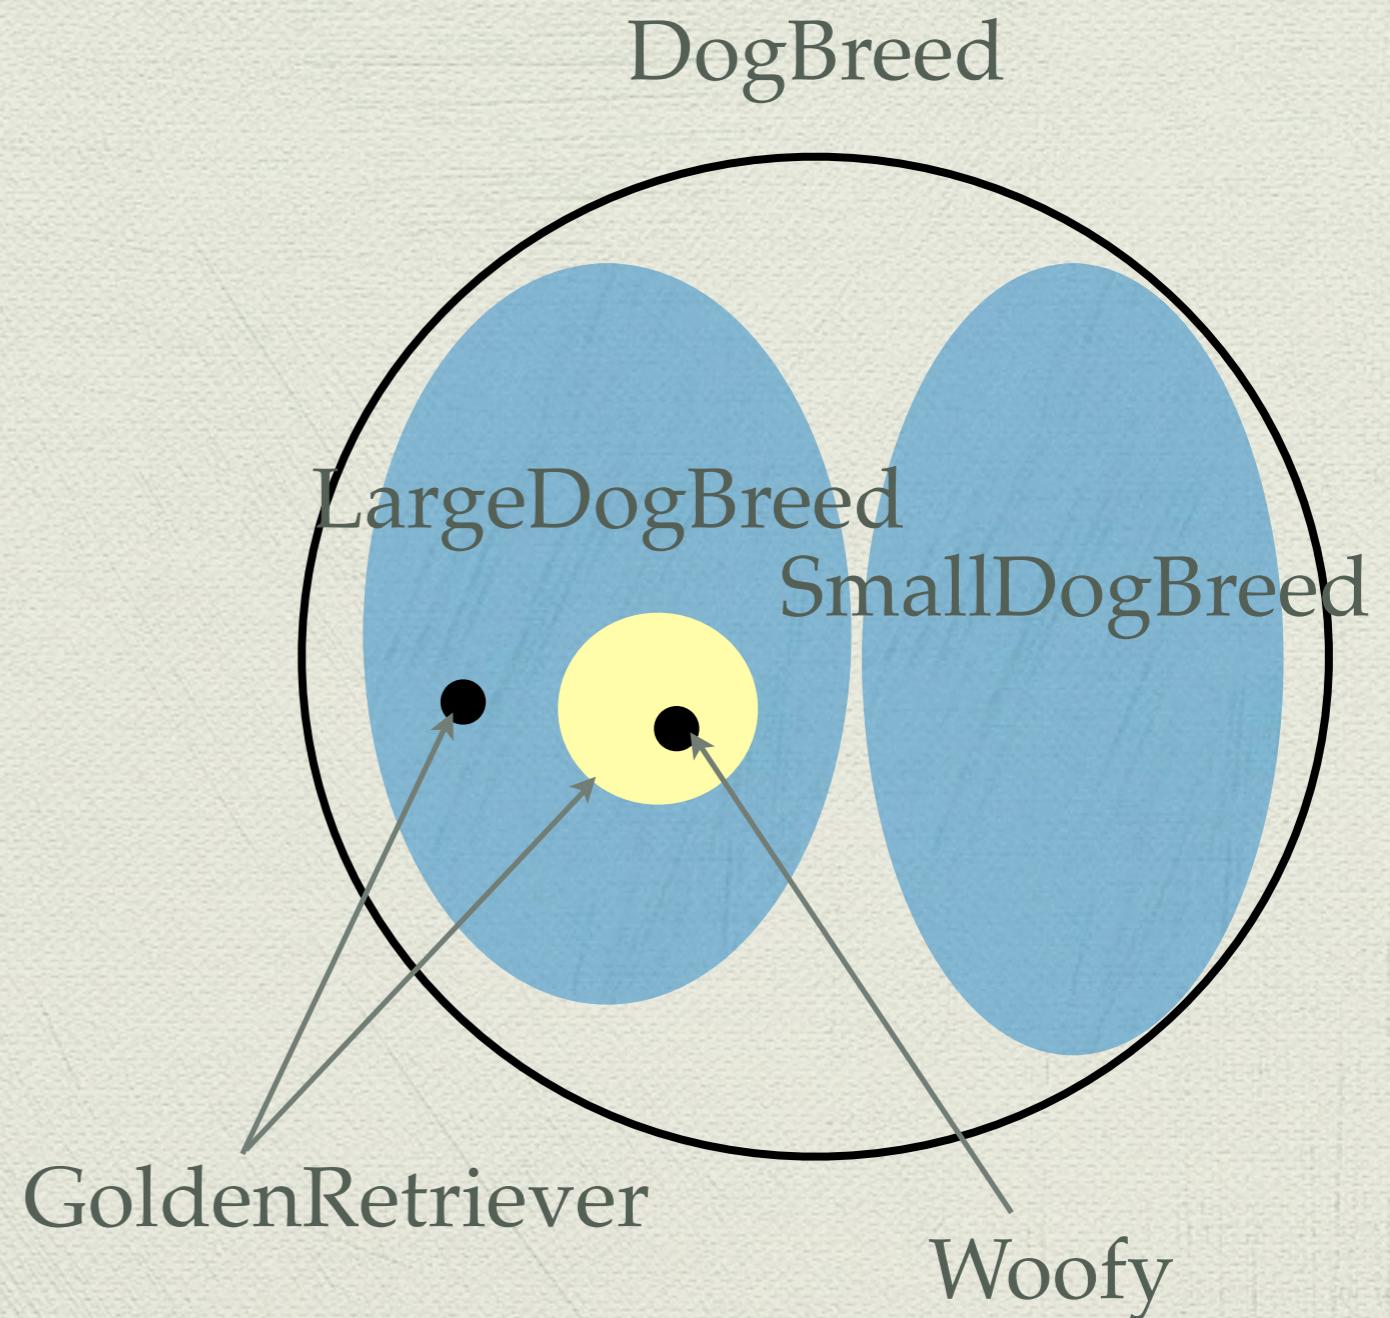

```
    rdfs:dubClassOf ex:Breed .
```

```
:GoldenRetriever rdf:type :LargeBreed .
```

OR

```
:GoldenRetriever rdf:type owl:Class;
```

```
    rdfs:subClassOf :LargeBreed .
```

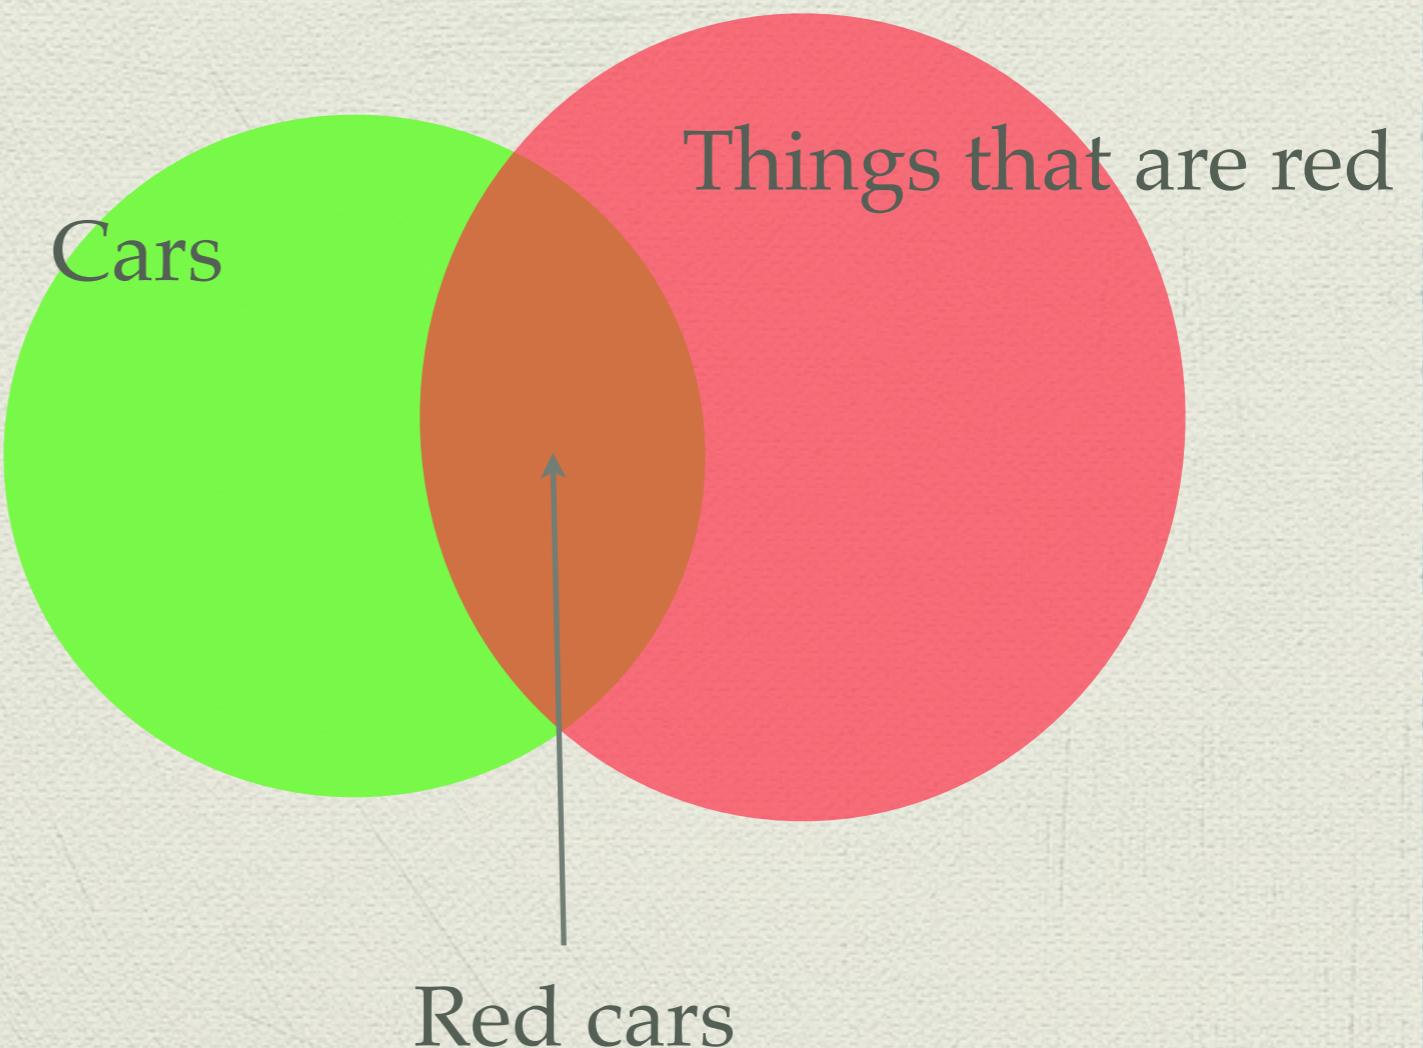

# So why do we need an ontology?

- ◆ Is Bordeaux a red or white wine?
- ◆ Does Cabernet Sauvignon go well with seafood?
- ◆ What is the best choice of wine for grilled meat?
- ◆ Which characteristics of a wine affect its appropriateness for a dish?
- ◆ Does a bouquet or body of a specific wine change with vintage year?
- ◆ What were good vintages for Napa Zinfandel?

# Some more advanced notions

- ◆ Defined classes
- ◆ Property restrictions
  - ◆ Value restriction
  - ◆ Cardinality restriction

# All Value restriction

```
<owl:Restriction>
  <owl:onProperty rdf:resource="#hasParent" />
  <owl:allValuesFrom rdf:resource="#Human" />
</owl:Restriction>
```

# Some Value restriction

```
<owl:Restriction>
  <owl:onProperty rdf:resource="#hasParent" />
  <owl:someValuesFrom rdf:resource="#Physician" />
</owl:Restriction>
```

# A more complex definition

```
<owl:Class rdf:ID="Operetta">
  <rdfs:subClassOf rdf:resource="#MusicalWork"/>
  <rdfs:subClassOf>
    <owl:Restriction>
      <owl:onProperty rdf:resource="#hasLibrettist" />
      <owl:minCardinality rdf:datatype="&xsd;nonNegativeInteger">1</
owl:minCardinality>
    </owl:Restriction>
  </rdfs:subClassOf>
  <rdfs:subClassOf>
    <owl:Class>
      <owl:complementOf rdf:resource="#Opera"/>
    </owl:Class>
  </rdfs:subClassOf>
</owl:Class>
```

# Equivalent class

```
<owl:Class rdf:about="#US_President">
  <equivalentClass rdf:resource="#PrincipalResidentofWhiteHouse"/>
</owl:Class>
```

```
<owl:Class rdf:ID="DaPonteOperaOfMozart">
  <owl:equivalentClass>
    <owl:Class>
      <owl:oneOf rdf:parseType="Collection">
        <Opera rdf:about="#Nozze_di_Figaro"/>
        <Opera rdf:about="#Don_Giovanni"/>
        <Opera rdf:about="#Cosi_fan_tutte"/>
      </owl:oneOf>
    </owl:Class>
  </owl:equivalentClass>
</owl:Class>
```

# Cardinality restrictions

- ◆ owl:minCardinality

- ◆ owl:maxCardinality

- ◆ owl:cardinality

```
<owl:Restriction>
```

```
  <owl:onProperty rdf:resource="#hasParent" />
```

```
  <owl:cardinality rdf:datatype="&xsd;nonNegativeInteger">2</owl:cardinality>
```

```
</owl:Restriction>
```

# Disjoint classes

- ◆ owl:disjointWith
- ◆ ex:Canine owl:disjointWith ex:Human
- ◆ Can solve some problems in inference with open world assumption

# Equivalence

- ◆ No unique name assumption
- ◆ Classes with different names can be equal
  - ◆ owl:equivalentClass
- ◆ Individuals with different names can be equal
  - ◆ owl:sameAs
- ◆ Then again, we can't assume that two individuals with different names ARE different:
  - ◆ owl:differentFrom
